

1

Let's # of students at Social High be 8 (I picked 8 as in this case $3/8$ of total and $5/8$ of total will be an integer).

$3/8$ of all students at Social High are in all three clubs --> $3/8 \cdot 8 = 3$ people are in exactly 3 clubs;

$1/2$ of all students are in Albanian club --> $1/2 \cdot 8 = 4$ people are in Albanian club;

$5/8$ of all students are in Bardic club --> $5/8 \cdot 8 = 5$ people are in Bardic club;

$3/4$ of all students are in Checkmate club --> $3/4 \cdot 8 = 6$ people are in Checkmate club;

Also as every student is in at least one club then # of students in neither of clubs is 0;

$\text{Total} = A + B + C - \{\text{\# of students in exactly 2 clubs}\} - 2 \cdot \{\text{\# of students in exactly 3 clubs}\} + \{\text{\# of students in neither of clubs}\};$

$8 = 4 + 5 + 6 - \{\text{\# of students in exactly 2 clubs}\} - 2 \cdot 3 + 0 \rightarrow \{\text{\# of students in exactly 2 clubs}\} = 1$, so fraction is $1/8$.

Answer: A.

2

Notice that "7 play both Hockey and Cricket" does not mean that out of those 7, some does not play Football too. The same for Cricket/Football and Hockey/Football.

$\{\text{Total}\} = \{\text{Hockey}\} + \{\text{Cricket}\} + \{\text{Football}\} - \{\text{HC} + \text{CH} + \text{HF}\} + \{\text{All three}\} + \{\text{Neither}\}$ For more check [ADVANCED OVERLAPPING SETS PROBLEMS](#)

$50 = 20 + 15 + 11 - (7 + 4 + 5) + \{\text{All three}\} + 18 \rightarrow \{\text{All three}\} = 2;$

Those who play ONLY Hockey and Cricket are $7 - 2 = 5;$

Those who play ONLY Cricket and Football are $4 - 2 = 2;$

Those who play ONLY Hockey and Football are $5 - 2 = 3;$

Hence, $5 + 2 + 3 = 10$ students play exactly two of these sports.

Answer: B.

3

"Each student is registered for at least one of three classes" means that there are no students who are registered for none of the classes.

$\text{Total} = \{\text{people in group A}\} + \{\text{people in group B}\} + \{\text{people in group C}\} - \{\text{people in exactly 2 groups}\} - 2 \cdot \{\text{people in exactly 3 groups}\} + \{\text{people in none of the groups}\};$

$68 = 25 + 25 + 34 - \{\text{people in exactly 2 groups}\} - 2 \cdot 3 + 0 \rightarrow \{\text{people in exactly 2 groups}\} = 10$

Answer: B.

Look at the diagram:

We need to find {people in exactly 2 groups}, so yellow section. Now, when we sum {people in group A} + {people in group B} + {people in group C} we count students who are in exactly 2 groups (yellow section) **twice**, so to get rid of double counting we are subtracting {people in exactly 2 groups} once.

Similarly when we sum {people in group A} + {people in group B} + {people in group C} we count students who are in exactly 3 groups (blue section) **thrice** (as it is the portion of all three groups), so to count this group only once we are subtracting $2 \times \{\text{people in exactly 3 groups}\}$.

4

Say $x\%$ of the employees own laptops. Since "the number of employees without laptops is 40% less than the employees with laptops", then $100 - x = 0.6 * x \rightarrow x = 62.5$, so 62.5% of the employees own laptops.

Next:

"44% of the employees that own laptops do not own cellphone", so 56% of the employees that own laptops own cellphone, so own both laptops and cellphone $\rightarrow 0.56 * 62.5 = \{\text{Both}\}$.

"30% of the employees that own cellphone do not own laptops", so 70% of the employees that own cellphone own laptops, so own both laptops and cellphone $\rightarrow 0.7 * y = \{\text{Both}\}$, where y is percentage of the employees who own cellphone.

From above: $0.56 * 62.5 = 0.7 * y \rightarrow y = 50$ and $\{\text{Both}\} = 0.7 * y = 35$, so 50% of the employees own cellphone and 35% of the employees own both laptops and cellphone.

$\{\text{Total}\} = \{\text{Laptops}\} + \{\text{Cellphone}\} - \{\text{Both}\} + \{\text{Neither}\} \rightarrow 100 = 62.5 + 50 - 35 + \{\text{Neither}\} \rightarrow \{\text{Neither}\} = 22.5\%$.

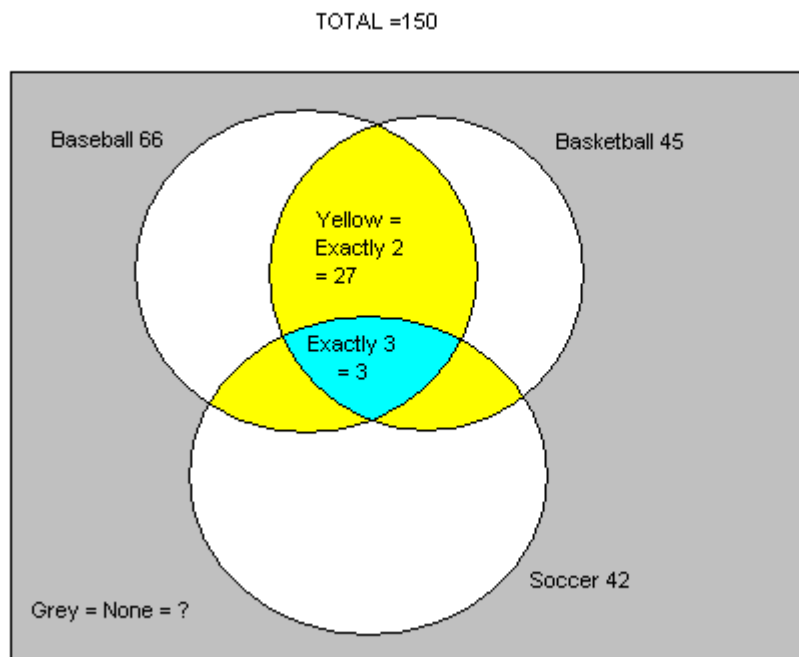

Answer: B.

5

$150 = \{\text{baseball}\} + \{\text{basketball}\} + \{\text{soccer}\} - \{\text{exactly 2 sports}\} - 2 * \{\text{exactly 3 sports}\} + \{\text{none of the sports}\}$:

$150 = 66 + 45 + 42 - 27 - 2 * 3 + \{\text{none of the sports}\} \rightarrow \{\text{none of the sports}\} = 30$

Answer: C.

When we sum {baseball} + {basketball} + {soccer} we count students who play exactly 2 sports (yellow section) **twice**, so to get rid of double counting we are subtracting {exactly 2 sports} once.

Similarly when we sum {baseball} + {basketball} + {soccer} we count students who play exactly 3 sports (blue section) **thrice** (as it is the portion of all three groups), so to count this group only once we are subtracting **2*{exactly 3 sports}**.
